

3D veneer

Along with the classic finishing of flat surfaces we can also offer the veneering of virtually any form with fine and exotic woods (also with stones, leather or carbons of all colors). Starting with 90° angles (even sharp angles are possible), that are covered without cutting the veneer, we dress curvatures up to full hemispheres (inside and outside), including complex forms and shapes. The 3D veneer itself can be made from a mix of different woods.

Our strength lies in the ability to cover almost any base materials (plastics, metals, woods, composite materials, etc.) without distorting them. Also the stability of the wood is assured, especially under the effects of heat, cold and humidity. As was realized with the steam wand of espresso machines, even steam-hot spots are absorbed without warping and distortion. Even delicate and flexible parts, such as frames of eye glasses can be covered with natural woods.
